

Al and Machine Learning for the Connected Home

Stephen Galsworthy, Quby

Session hashtag: #SAISAI4

Our history in milestones

2004

Home Automation Europe is founded

2006

Home control alternatives are prototyped

2012

Home Automation Europe partners with Eneco to create Toon

2013

Home Automation Europe becomes **Quby**

2018

Launch Toon2

2018

launch security service
ThuisWacht with Interpolis

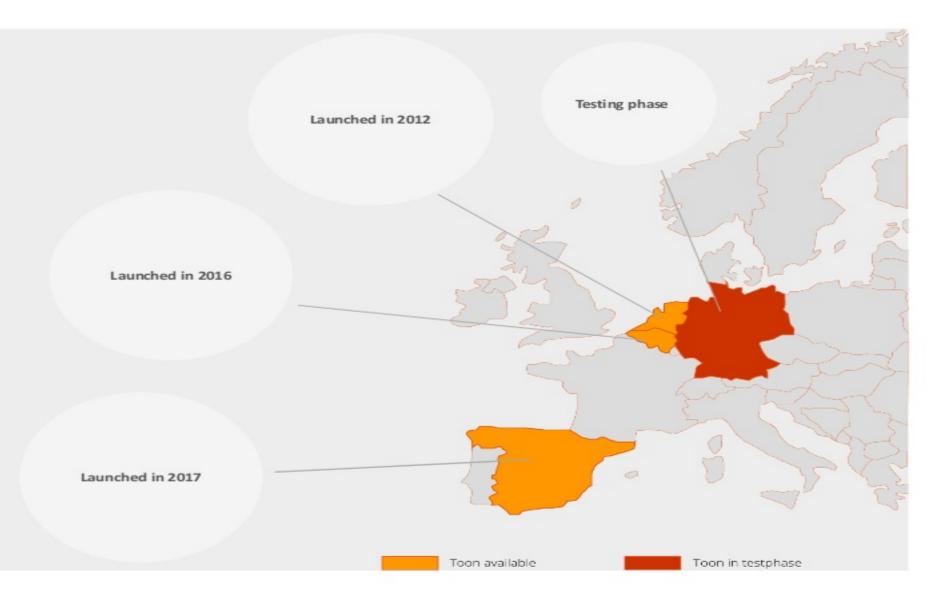

Interpolis.

TOON

ENERGY INSIGHTS APP

SMART METER DONGLE & APP **SMART THERMOSTAT &** APP

SECURITY PACKAGE & APP

DATA SERVICES

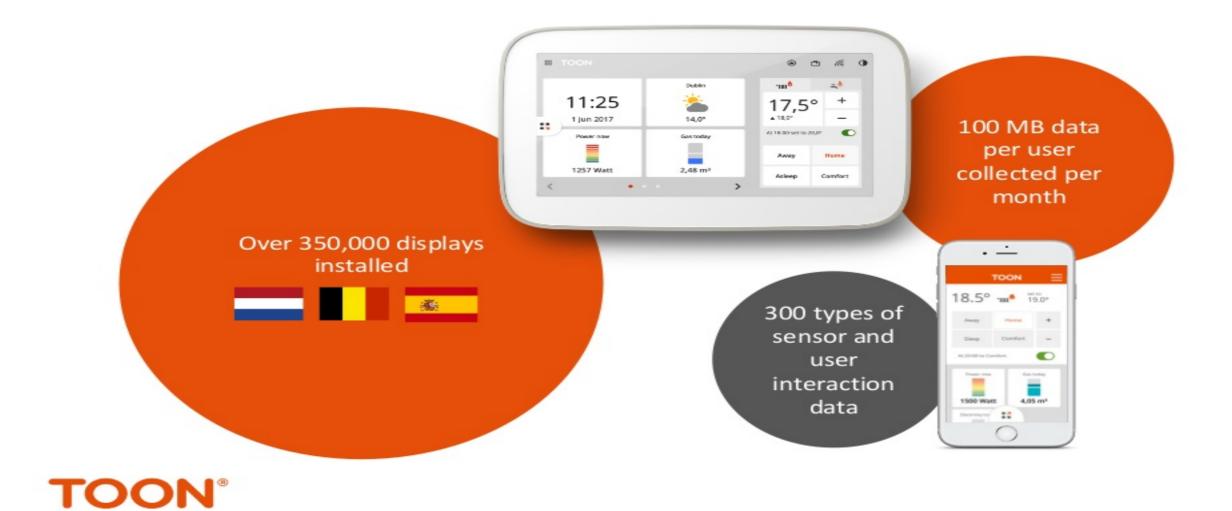

WATER INSIGHT

MONTHLY ENERGY INSIGHT

BOILER MONITORING

Our Data Science platform aws Spork Scala databricks apigee

TOON®

Big data storage and processing

For machine learning on distributed data

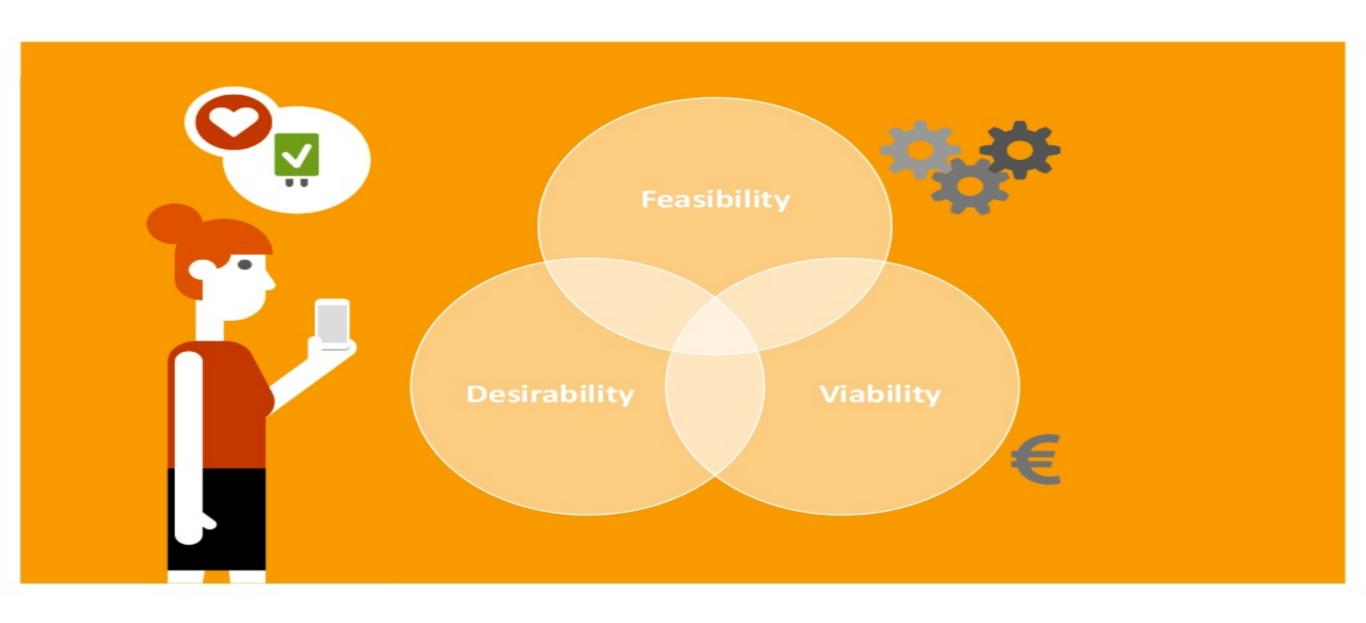

For production grade algorithms and R&D

- Spark cluster management
- Collaboration using shared notebooks
- Scheduling complex workflows
- Dashboards

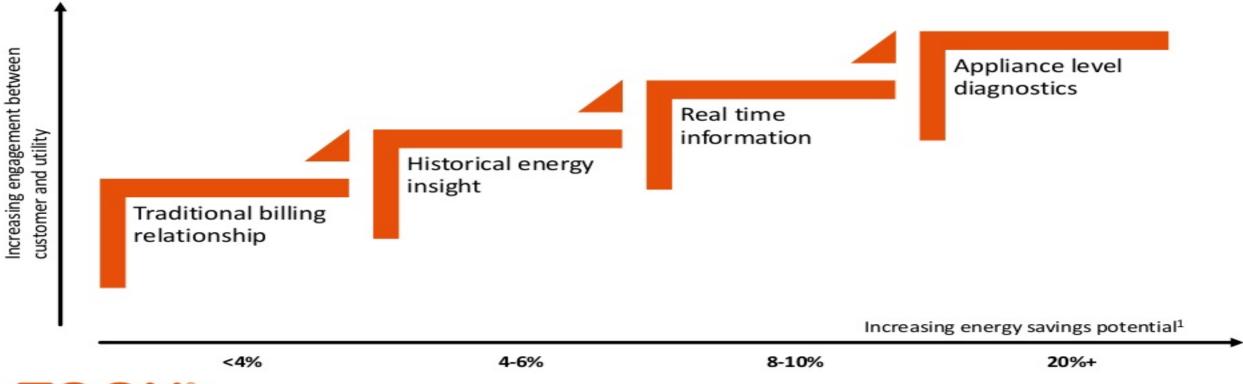

API management

Creating data driven services

Maximizing energy savings and customer engagement

Energy Waste Checker

"We don't always notice how much energy we're wasting. Toon can now expose the energy guzzlers in your home."

Launched in December 2017 to all Eneco Toon users

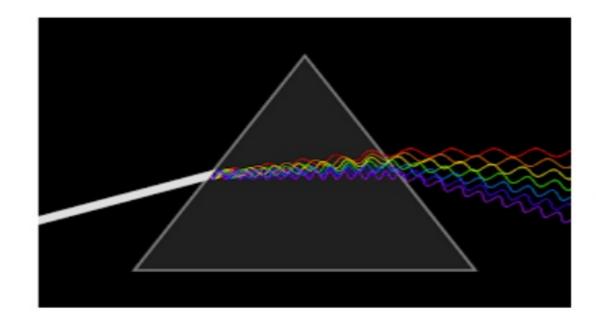

Toon detects inefficient appliances and behaviours

Key technology: load disaggregation algorithms

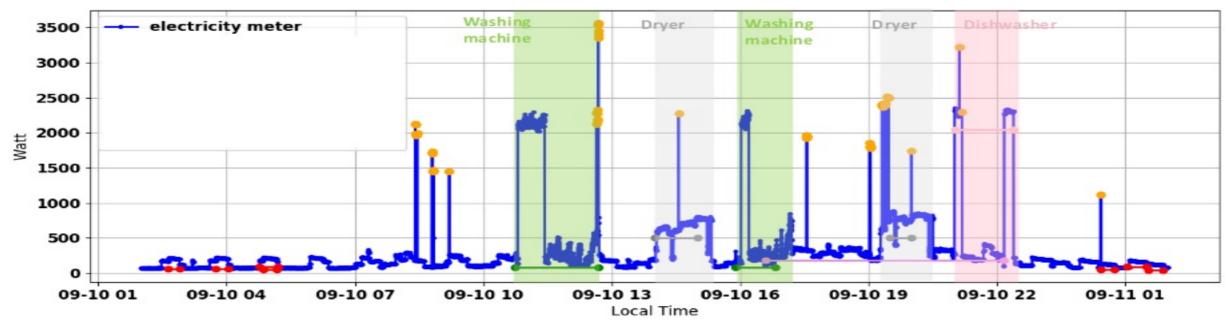

Appliance signals

Electricity data

Quby's disaggregation algorithms

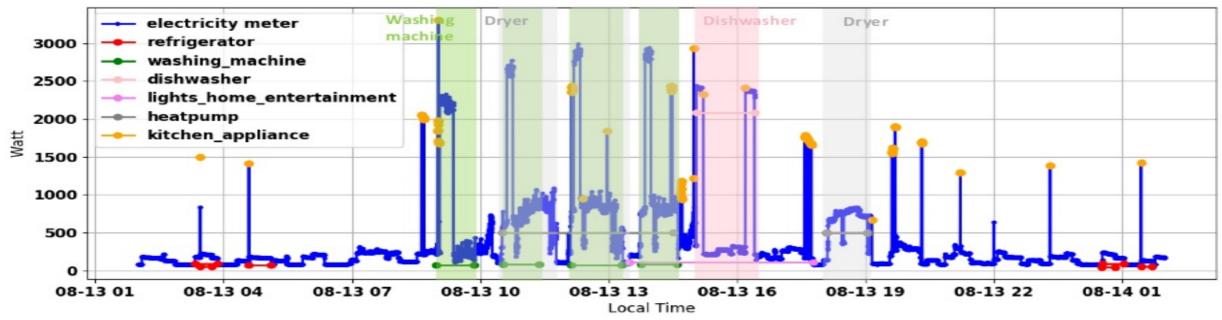

Patent pending algorithms can detect appliances from 10 second resolution electricity meter data

Quby's disaggregation algorithms

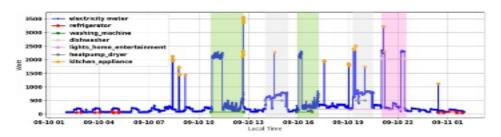

But users try to make it complicated for us...

Use case example: Inefficient dishwasher diagnosis

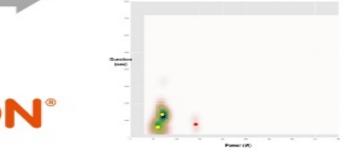

Disaggregation algorithms run on the 10s electricity meter data

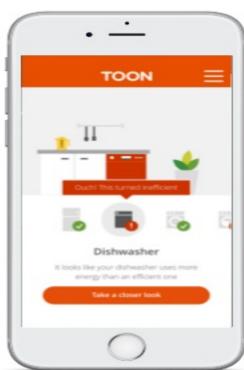

Compared with industry energy consumption standards and peers

Toon determines the "fingerprint" of the appliance through features

Translated to personalised advice for the end user

Scale of the Waste checker

POP QUIZ

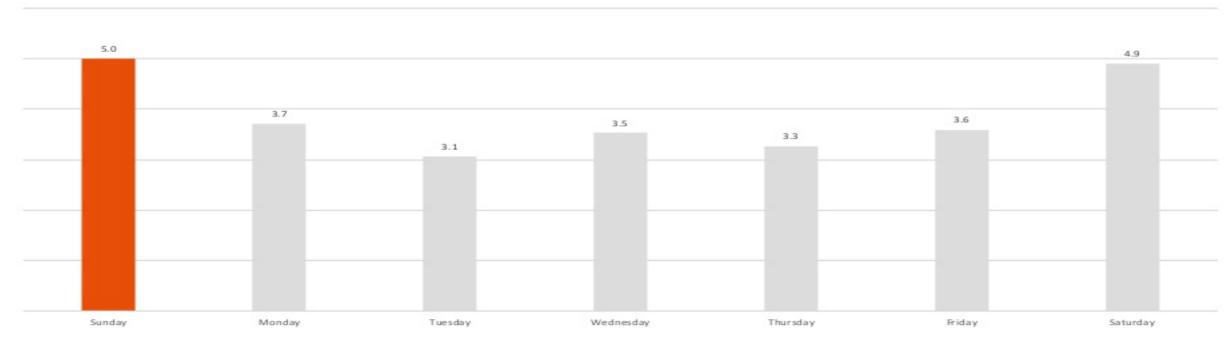

Which is the most popular day of the week to do the laundry?

TOON®

It's Sunday!

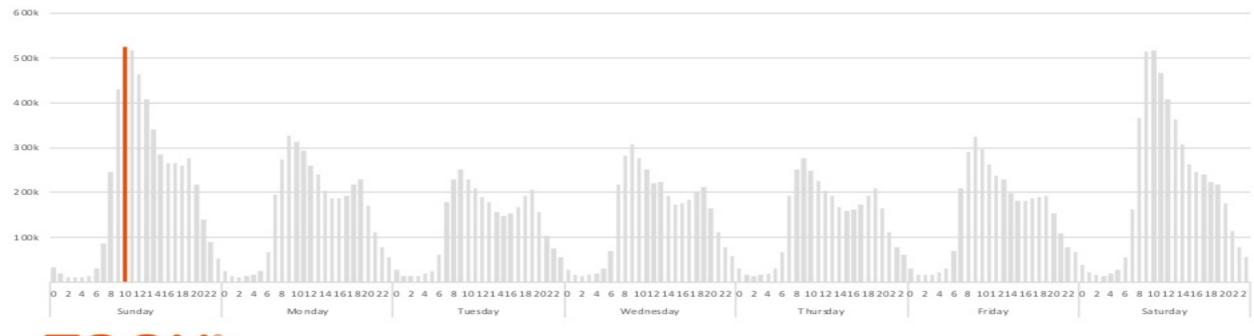

with 5.0 million of the 27 million washing machine detections we've made in 2018 so far

It's Sunday!

with 5.0 million of the 27 million washing machine detections we've made in 2018 so far

Heating system anomaly detection

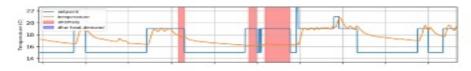

Enhancement to our existing Boiler Monitoring service

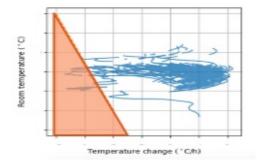

Heating system anomaly detection

 Boiler and thermostat data are constantly monitored by Toon

Toon determines when the system leaves its normal operating range

Severity and user preferences taken into account

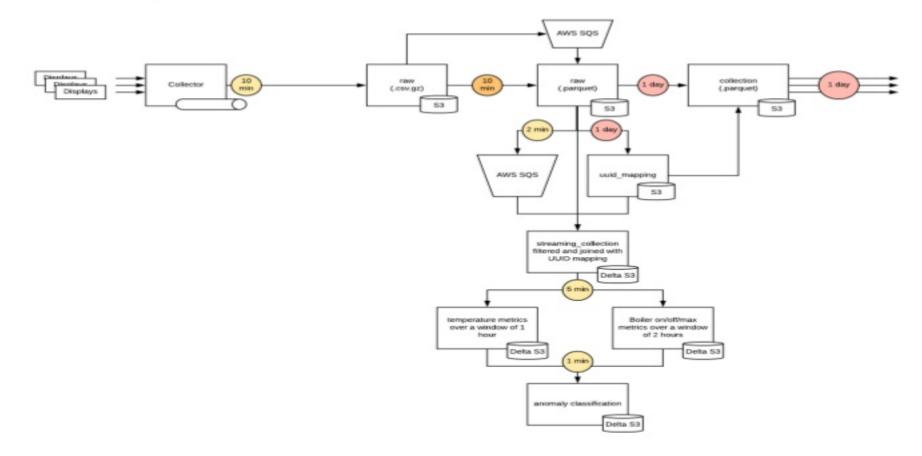

4. Toon user is alerted

Heating system anomaly detection

5 things we learned

#1: We love Spark

Machine learning on distributed data is key to all of this working at scale.

An example: Spark's window functions work great for time series data.

#2: We prefer Scala now

Moving from Python to Scala takes effort but it's worth it.

An example: We define our dataset schemas statically. Static typing and type inference in Scala helps enforce these schemas.

#3: We live in the cloud

Rather than taking care of the infrastructure, data engineers can concentrate on how to make data available to the business.

The Databricks platform gives us cluster timeouts, autoscaling, spot instances...all without the need for additional FTEs.

#4: 'In production' is not the end

Continuous feedback from hundreds of thousands of users means there's always improvements to make.

An example: Our users told us that they wanted more information about their efficient appliances, such as heat pump dryers. We productionized a **deep learning** model to give them this info.

#5: Full-stack data science rocks!

Build and run, from initial concept to end result. Making services that our end users will love.

Working together we deliver state-of-the-art algorithms operating at scale in production.
